

POT MIXTURE FOR NURSERY

The process of starting vegetable cultivation from seed is a very delicate process and great care should be given at this particular phase. The pot mixture is prepared by mixing various ingredients. A good pot mixture consists of equal parts of sieved garden soil (top soil) and compost.

An ideal pot mixture should have an open structure, which allows good drainage and holds sufficient moisture for plant growth and permits excess water to drain away. Pot mixture must supply adequate nutrient to the plants during all stages of growth, be free from all harmful organisms and toxic minerals and also light in weight.

APPLICATION:

Pot mixture is used for sowing of seeds, for seedlings, cuttings and grafts. It is important to ensure that plants receive enough of nutrition to build their immunity for the future. Especially for the germination of seeds, this healthy pot mixture rich in organic matter acts in facilitating healthy saplings.
